

PRESS RELEASE

New situational awareness software developed by iTrack Solutions

Calgary, Alberta 18 March 2015 – Integrated Tracking Solutions Inc. is pleased to announce the release of its Loki Gen.6 situational awareness software. Loki Gen.6 is web based software which has been under development for the past two years. It is derived from a series of earlier Loki software products which were focused on asset tracking for large fleets of vehicles.

Asset tracking software provides information on the current location and status of mobile assets. This information is presented to the users on a map background. Many users are themselves mobile, and situational awareness software addresses the additional needs of these users. Loki Gen.6 does this with the following features.

Home – a configurable dashboard, showing plans, schedules, calendars, other detail on what should be going on today.

Live View – the current picture, anywhere in the world, shown on mapping from BING. This includes mapping, satellite and air photo imagery, as well as mapping provided by the customer. Video streams are supported. A 3D viewing feature is also provided from Cesium. A user can add or draw features on the mapping, and share this with other users.

Communication – users can communicate one to one, or through a chat room. A video call feature is also provided.

Management – an administrative user can assign tracking devices to vehicles, vehicles to sub-groups, sub-groups to larger groups, drivers to vehicles. An administrator can also set privileges for the individual users.

Access to data – users can generate and view a replay on the fly, as well as generate reports showing vehicle tracks, hours in service, mileage, stop locations, speeds.

Observations, Analysis – a forum feature is provided for group discussion. What happened today, and why did it happen? What can be done better in the future? This becomes part of the Loki database, and is searchable. Observations can be linked to reports and replays.
